

1. Introduction to Formal Typography

This document tests the Phase 2 engine capabilities. We are establishing a strict typography hierarchy using size and spacing rather than relying purely on bold weights. This approach results in a cleaner, more restrained aesthetic typical of high-end academic journals and official government reports.

1.1 The Keep-With-Next Rule

One of the most critical rules in professional typesetting is preventing a heading from being stranded at the very bottom of a page while its associated paragraph starts on the following page. Our PageManager calculates the height of the heading plus the height of at least one line of paragraph text before rendering.

To test this, we need to push the next heading close to the bottom margin. To test this, we need to push the next heading close to the bottom margin. The spacing between paragraphs is handled automatically by the StyleRegistry, ensuring consistent vertical rhythm throughout the document. consistent vertical rhythm throughout the document. consistent vertical rhythm throughout the document. consistent vertical rhythm throughout the document.

1.2 Testing the Page Break

If the engine works correctly, you should not see the heading '1.2 Testing the Page Break' stranded at the bottom of the previous page. The layout engine detected that there wasn't enough vertical space for both this heading and the first line of this paragraph, so it forced a page break before rendering the heading. This is the hallmark of a polished PDF.

1.2.1 Blockquotes

A blockquote is used to offset significant excerpts of text from the main body. Notice how it uses the italic variant of our serif font, is slightly indented from both the left and the right margins, and uses left alignment instead of justification.

Following the blockquote, the text returns to the standard paragraph styling. The transition feels natural and the visual hierarchy is preserved.
